## Chapter 1

# Unified Collective Communications (UCC) Library Specification

UCC is a collective communication operations API and library that is flexible, complete, and feature-rich for current and emerging programming models and runtimes.

# Chapter 2

## Design

- Highly scalable and performant collectives for HPC, AI/ML and I/O workloads
- Nonblocking collective operations that cover a variety of programming models
- Flexible resource allocation model
- Support for relaxed ordering model
- Flexible synchronous model
- Repetitive collective operations (init once and invoke multiple times)
- Hardware collectives are a first-class citizen

### 2.0.1 Component Diagram

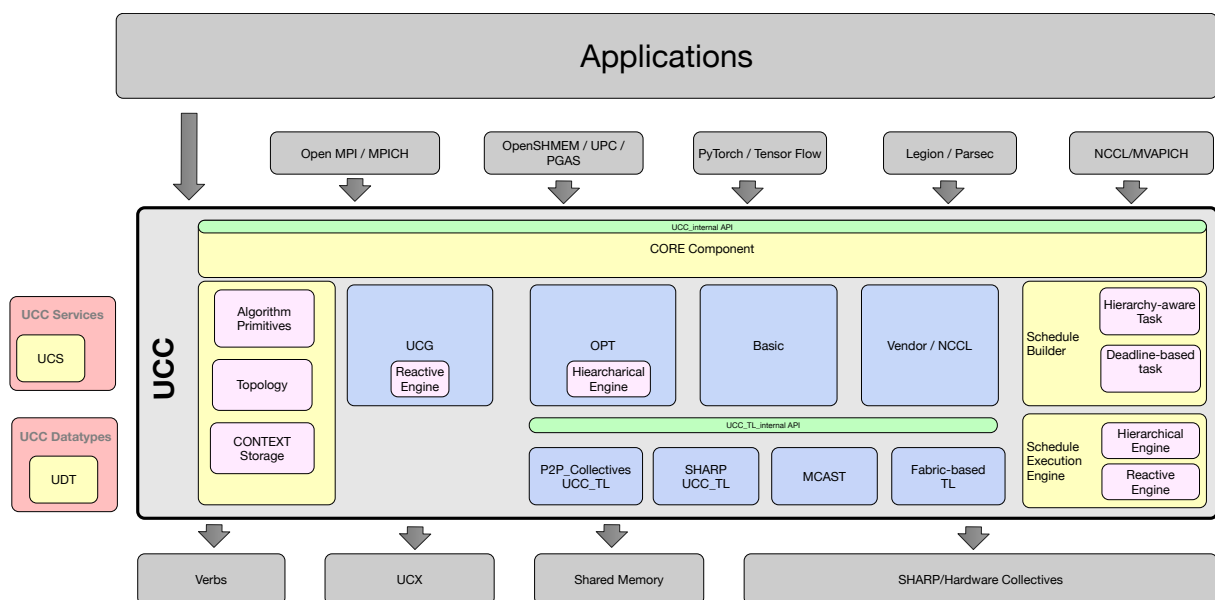

Figure 2.1: UCC Components and Usage

## Chapter 3

# Library Initialization and Finalization

These routines are responsible for allocating, initializing, and finalizing the resources for the library.

The UCC can be configured in three thread modes `UCC_THREAD_SINGLE`, `UCC_THREAD_FUNNELED`, and `UCC_LIB_THREAD_MULTIPLE`. In the `UCC_THREAD_SINGLE` mode, the user program must not be multithreaded. In the `UCC_THREAD_FUNNELED` mode, the user program may be multithreaded. However, all UCC interfaces should be invoked from the same thread. In the `UCC_THREAD_MULTIPLE` mode, the user program can be multithreaded and any thread may invoke the UCC operations.

The user can request different types of collective operations that vary in their synchronization models. The valid synchronization models are `UCC_NO_SYNC_COLLECTIVES` and `UCC_SYNC_COLLECTIVES`. The details of these synchronization models are described in the collective operation section.

The user can request the different collective operations and reduction operations required. The complete set of valid collective operations and reduction types are defined with the structures `ucc_coll_type_t` and `ucc_reduction_op_t`.

## Chapter 4

# Communication Context

The `ucc_context_h` is a communication context handle. It can encapsulate resources required for collective operations on team handles. The contexts are created by the `ucc_context_create` operation and destroyed by the `ucc_context_destroy` operation. The create operation takes in user-configured `ucc_context_params_t` structure to customize the context handle. The attributes of the context created can be queried using the `ucc_context_get_attrbs` operation.

When no out-of-band operation (OOB) is provided, the `ucc_context_create` operation is local requiring no communication with other participants. When OOB operation is provided, all participants of the OOB operation should participate in the create operation. If the context operation is a collective operation, the `ucc_context_destroy` operation is also a collective operation .i.e., all participants should call the destroy operation.

The context can be created as an exclusive type or shared type by passing constants `UCC_CONTEXT_EXCLUSIVE` and `UCC_CONTEXT_SHARED` respectively to the `ucc_context_params_t` structure. When context is created as a shared type, the same context handle can be used to create multiple teams. When context is created as an exclusive type, the context can be used to create multiple teams but the team handles cannot be valid at the same time; a valid team is defined as a team object where the user can post collective operations.

Notes : From the user perspective, the context handle represents a communication resource. The user can create one context and use it for multiple teams or use with a single team. This provides a finer control of resources for the user. From the library implementation perspective, the context could represent the network parallelism. The UCC library implementation can choose to abstract injection queues, network endpoints, GPU device context, UCP worker, or UCP endpoints using the communication context handles.

# Chapter 5

## Teams

The `ucc_team_h` is a team handle, which encapsulates the resources required for group operations such as collective communication operations. The participants of the group operations can either be an OS process, a control thread or a task.

Create and destroy routines: `ucc_team_create_post` routine is used to create the team handle and `ucc_team_create_test` routine for learning the status of the create operation. The team handle is destroyed by the `ucc_team_destroy` operation. A team handle is customized using the user configured `ucc_team_params_t` structure.

**Invocation semantics:** The `ucc_team_create_post` is a nonblocking collective operation, in which the participants are determined by the user-provided OOB collective operation. Overlapping of multiple `ucc_team_create_post` operations are invalid. Posting a collective operation before the team handle is created is invalid. The team handle is destroyed by a blocking collective operation; the participants of this collective operation are the same as the create operation. When the user does not provide an OOB collective operation, all participants calling the `ucc_create_post` operation will be part of a new team created.

**Communication Contexts:** Each process or a thread participating in the team creation operation contributes one or more communication contexts to the operation. The number of contexts provided by all participants should be the same and each participant should provide the same type of context. The newly created team uses the context for collective operations. If the communication context abstracts the resources for the library, the collective operations on this team uses the resources provided by the context.

**Endpoints:** That participants to the `ucc_team_create_post` operation can provide an endpoint, a 64-bit unsigned integer. The endpoint is an address for communication. Each participant of the team has a unique integer as endpoint .i.e., the participants of the team do not share the same endpoint. For example, the user can bind the endpoint to the parallel programming model's index such as OpenSHMEM PE, an OS process ID, or a thread ID. The UCC implementation can use the endpoint as an index to identify the resources required for communication such as communication contexts. When the user does not provide the endpoint, the library generates the endpoint, which can be queried by the user. In addition to the endpoint, the user can provide information about the endpoints such as whether the endpoint is a continuous range or not.

**Ordering:** The collective operations on the team can either be ordered or unordered. In the ordered model, the UCC collectives are invoked in order .i.e., on a given team, each of the participants of the collective operation invokes the operation in the same order. In the unordered model, the collective operations are not necessarily invoked in the same order.

**Interaction with Threads:** The team can be created in either mode .i.e., the library initialized by `UCC_LIB_THREAD_MULTIPLE`, `UCC_LIB_THREAD_SINGLE`, or `UCC_LIB_THREAD_FUNNELED`. In the `UCC_LIB_THREAD_MULTIPLE` mode, each of the user threads can post a collective operation. However, it is not valid to post concurrent collectives operations from multiple threads to the same team.

**Memory per Team:** A team can be configured by a memory descriptor described by `ucc_mem_map_params_t` structure. The memory can be used as an input and output buffers for the collective operation. This is particularly useful for PGAS programming models, where the input and output buffers are defined before the invocation operation. For example, the input and output buffers in the OpenSHMEM programming model are defined during the programming model initialization.

**Synchronization Model:** The team can be configured to support either synchronized collectives or non-synchronized collectives. If the UCC library is configured with synchronized collective operations and the team is configured with non-synchronized collective operations, the library might not be able to provide any optimizations and might support only synchronized collective operations.

**Outstanding Calls:** The user can configure maximum number of outstanding collective operations of any type for a given team. This is represented by an unsigned integer. This is provided as a hint to the library for resource management.

**Team ID:** The team identifier is a unique 64-bit unsigned integer for the given process .i.e, the team identifier should be unique for all teams it creates or participates. If the team identifier is provided by the user, it should be passed as a configuration parameter to the team create operation.

### Split Team Operations

The team split routines provide an alternate way to create teams. All split routines require a parent team and all participants of the parent team call the split operation. The participants of the new team may include some or all participants of the parent team.

The newly created team shares the communication contexts with the parent team. The endpoint of the new team is contiguous and is not related to the parent team. It inherits the thread model, synchronization model, collective ordering model, outstanding collectives configuration, and memory descriptor from the parent team.

The split operation can be called by multiple threads, if the parent team to the split operations are different and if it agrees with the thread model of the UCC library.

Notes: The rationale behind requiring all participants of the parent team to participate in the split operation is to avoid overlapping participants between multiple split operations, which is known to increase the implementation complexity. Also, currently, higher-level programming models do not require these semantics.

## Chapter 6

# Starting and Completing the Collectives

A UCC collective operation is a group communication operation among the participants of the team. All participants of the team are required to call the collective operation. Each participant is represented by the endpoint that is unique to the team used for the collective operation. This section provides a set of routines for launching, progressing, and completing the collective operations.

**Invocation semantics:** The `ucc_collective_init` routine is a non-blocking collective operation to initialize the buffers, operation type, reduction type, and other information required for the collective operation. All participants of the team should call the initialize operation. The routine returns once the participants enter the collective initialize operation. The collective operation is invoked using a `ucc_collective_post` operation. `ucc_collective_init_and_post` operation initializes as well as post the collective operation.

**Collective type:** The collective operation supported by UCC is defined by the enumeration `ucc_coll_type_t`. It supports three types of collective operations: (a) `UCC_{ALLTOALL,ALLTOALLV, ALLGATHER, ALLGATHERV, ALLREDUCE, REDUCE_SCATTER, REDUCE_SCATTERV, BARRIER}` operations where all participants contribute to the results and receive the results (b) `UCC_{REDUCE, GATHER, GATHERV, FANIN}` where all participants contribute to the result and one participant receives the result. The participant receiving the result is designated as root. (c) `UCC_{BROADCAST, SCATTER, SCATTERV, FANOUT}` where one participant contributes to the result, and all participants receive the result. The participant contributing to the result is designated as root.

**Reduction types:** The reduction operation supported by `UCC_{ALLREDUCE, REDUCE}` operation is defined by the enumeration `ucc_op_t`. The valid datatypes for the reduction is defined by the enumeration `ucc_datatype_t`.

**Ordering:** The team can be configured for ordered collective operations or unordered collective operations. For unordered collectives, the user is required to provide the “tag”, which is an unsigned 64-bit integer.

**Synchronized and Non-Synchronized Collectives:** In the synchronized collective model, on entry, the participants cannot read or write to other participants without ensuring all participants have entered the collective operation. On the exit of the collective operation, the participants may exit after all participants have completed the reading or writing to the buffers.

In the non-synchronized collective model, on entry, the participants can read or write to other participants. If the input and output buffers are defined on the team and RMA operations are used for data transfer, it is the responsibility of the user to ensure the readiness of the buffer. On exit, the participants may exit once the read and write to the local buffers are completed.

**Buffer Ownership:** The ownership of input and output buffers are transferred from the user to the library after invoking the `ucc_collective_init` routine and on return from the routine, the ownership is transferred back to the user. However, after invoking and returning from `ucc_collective_post` or `ucc_collective_init_and_post` routines, the ownership stays with the library and it is returned to the user, when the collective is completed.

**The** table below lists the necessary fields that user must initialize depending on the collective operation type.

## Chapter 7

# Execution Engine and Events

The execution engine is an execution context that supports event-driven network execution on the CUDA streams, CPU threads, and DPU threads. It is intended to interact with execution threads that are asynchronous (offloaded collective execution) which can be implemented on GPUs, DPUs, or remote CPUs.

UCC supports triggering collective operations by library-generated and user-generated events. The library events are generated on posting or completion of operations. The user-generated events include the completion of compute or communication operations. With a combination of library-generated and user-generated events, one can build dependencies between compute and collective operations, or between the collective operations.

Besides the execution engine, events are key for event-driven execution. The operations on the execution engines generate events that are stored internally on the execution engines. The valid events are defined by [ucc\\_event\\_type\\_t](#). If the underlying hardware doesn't support event-driven execution, the implementations can implement this with the event queues or lists.

The interaction between the user and library is through the UCC interfaces. [ucc\\_ee\\_create](#) creates execution engines. The user or library can generate an event and post it to the execution engines using [ucc\\_ee\\_set\\_event](#) interface. The user can wait on the events with the [ucc\\_ee\\_wait](#) interface. The user can get the event from the ee using [ucc\\_ee\\_get\\_event](#) interface and acknowledge the event with [ucc\\_ee\\_ack\\_event](#) interface. Once acknowledged, the library destroys the event.

Thread Mode: While in the `UCC_THREAD_MULTIPLE` mode, the execution engine and operations can be invoked from multiple threads.

Order: All non-triggered operations posted to the execution engine are executed in-order. However, there are no ordering guarantees between the execution engines.

### 7.0.1 Triggered Operations

Triggered operations enable the posting of operations on an event. For triggered operations, the team should be configured with event-driven execution. The collection operations is defined by the interface [ucc\\_collective\\_triggered\\_post](#).

The operations are launched on the event. So, there is no order established by the library. If user desires an order for the triggered operations, the user should provide the tag for matching the collective operations.

### 7.0.2 Interaction between an User Thread and Event-driven UCC

The figure shows the interaction between application threads and the UCC library configured with event-driven teams. In this example scenario, we assume that the UCC team are configured with two events queues - one for post operations and one for completions.

(1) The application initializes the collective operation when it knows the control parameters of the collective such as buffer addresses, lengths, and participants of the collective. The data need not be ready as it posts

the collective operation which will be triggered on an event. For example, the event here is the completion of compute by the application.

- (2) When the application completes the compute, it posts the `UCC_EVENT_COMPUTE_COMPLETE` event to the execution engine.
- (3) The library thread polls the event queue and triggers the operations that are related to the compute event.
- (4) The library posts the `UCC_EVENT_POST_COMPLETE` event to the event queue.
- (5) On completion of the collective operation, the library posts `UCC_EVENT_COLLECTIVE_COMPLETE` event to the completion event queue.

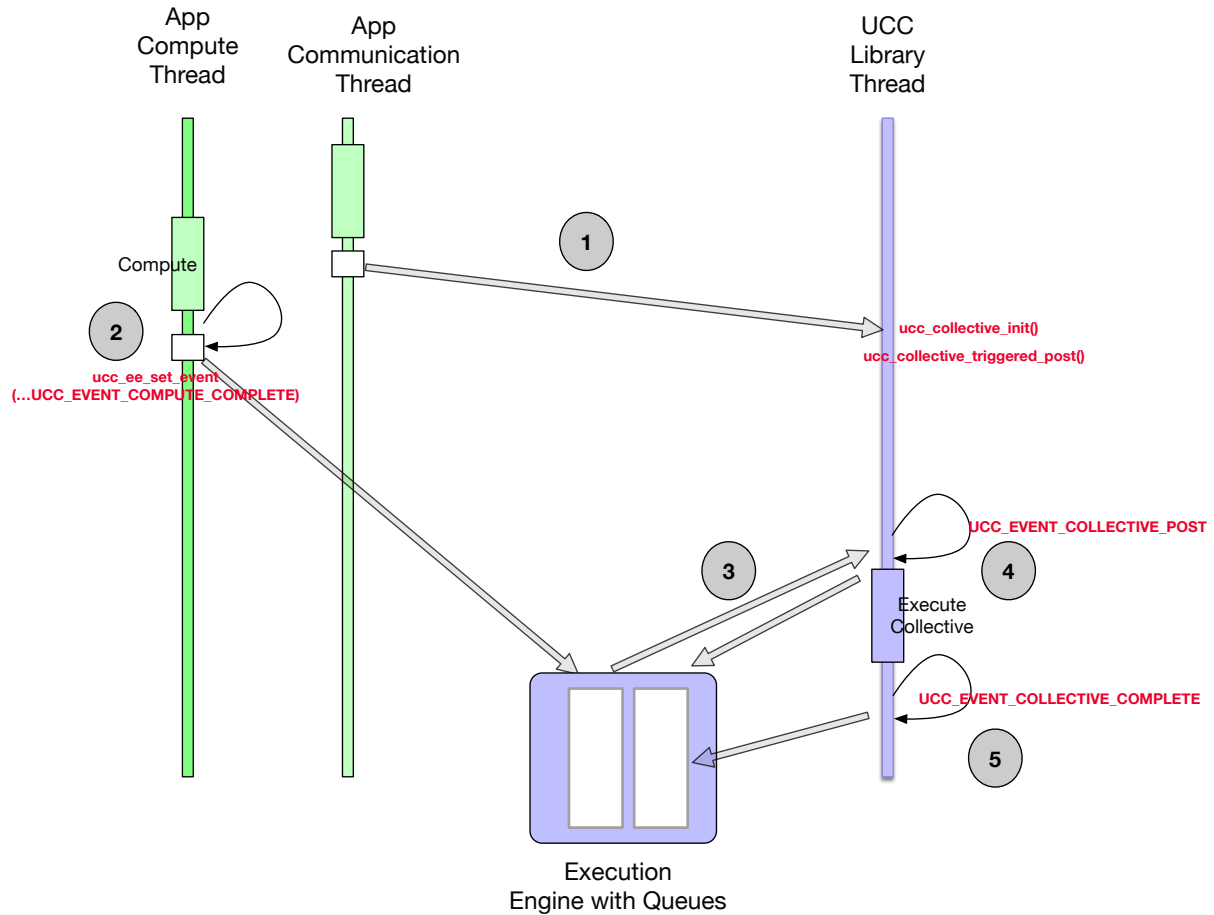

Figure 7.1: UCC Execution Engine and Events

## Chapter 8

`UCC_LIB_ATTR_FIELD_SYNC_TYPE` = `UCC_BIT(3)` }

### 8.1.1 Detailed Description

Unified Collective Communications (UCC) Library Specification

UCC is a collective communication operations API and library that is flexible, complete, and feature-rich for current and emerging programming models and runtimes.

Library initialization parameters and data-structures

### 8.1.2 Data Structure Documentation

#### 8.1.2.1 struct ucc\_lib\_params

Description

[ucc\\_lib\\_params\\_t](#) defines the parameters that can be used to customize the library. The bits in "mask" bit array is defined by [ucc\\_lib\\_params\\_field](#), which correspond to fields in structure [ucc\\_lib\\_params\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

Data Fields

uint64_t	mask	
<a href="#">ucc_thread_mode_t</a>	thread_mode	
uint64_t	coll_types	
uint64_t	reduction_types	
<a href="#">ucc_coll_sync_type_t</a>	sync_type	
<a href="#">ucc_reduction_wrapper_t</a>	reduction_wrapper	

#### 8.1.2.2 struct ucc\_lib\_attr

Description

[ucc\\_lib\\_attr\\_t](#) defines the attributes of the library. The bits in "mask" bit array is defined by [ucc\\_lib\\_attr\\_field](#), which correspond to fields in structure [ucc\\_lib\\_attr\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

Data Fields

uint64_t	mask	
<a href="#">ucc_thread_mode_t</a>	thread_mode	
uint64_t	coll_types	
uint64_t	reduction_types	
<a href="#">ucc_coll_sync_type_t</a>	sync_type	

### 8.1.3 Typedef Documentation

#### 8.1.3.1 ucc\_lib\_params\_t

```
typedef struct ucc_lib_params ucc_lib_params_t
```

## Description

`ucc_lib_params_t` defines the parameters that can be used to customize the library. The bits in "mask" bit array is defined by `ucc_lib_params_field`, which correspond to fields in structure `ucc_lib_params_t`. The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

8.1.3.2 `ucc_lib_attr_t`

```
typedef struct ucc_lib_attr ucc_lib_attr_t
```

## Description

`ucc_lib_attr_t` defines the attributes of the library. The bits in "mask" bit array is defined by `ucc_lib_attr_field`, which correspond to fields in structure `ucc_lib_attr_t`. The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

8.1.3.3 `ucc_lib_h`

```
typedef struct ucc_lib_info* ucc_lib_h
```

The ucc library handle is an opaque handle created by the library. It abstracts the collective library. It holds the global information and resources associated with the library. The library handle cannot be passed from one library instance to another.

8.1.3.4 `ucc_lib_config_h`

```
typedef struct ucc_lib_config* ucc_lib_config_h
```

## 8.1.4 Enumeration Type Documentation

8.1.4.1 `ucc_reduction_op_t`

```
enum ucc_reduction_op_t
```

---

Library initialization and finalize

---

## Description

`ucc_reduction_op_t` represents the UCC reduction operations. It is used by the library initialization routine `ucc_init` to request the operations expected by the user. It is used by the `ucc_lib_attr_t` to communicate the operations supported by the library. The user-defined reductions are represented by `UCC_OP_USERDEFINED`.

## Enumerator

<code>UCC_OP_USERDEFINED</code>	User defined reduction operation
<code>UCC_OP_SUM</code>	Predefined addition operation
<code>UCC_OP_PROD</code>	
<code>UCC_OP_MAX</code>	
<code>UCC_OP_MIN</code>	
<code>UCC_OP_LAND</code>	
<code>UCC_OP_LOR</code>	

Enumerator

UCC_OP_LXOR	
UCC_OP_BAND	
UCC_OP_BOR	
UCC_OP_BXOR	
UCC_OP_MAXLOC	
UCC_OP_MINLOC	

#### 8.1.4.2 ucc\_coll\_type\_t

enum [ucc\\_coll\\_type\\_t](#)

Description

[ucc\\_coll\\_type\\_t](#) represents the collective operations supported by the UCC library. Currently, it supports barrier, broadcast, all-reduce, reduce, alltoall, all-gather, gather, scatter, fan-in and fan-out operations.

Enumerator

UCC_COLL_TYPE_ALLGATHER	
UCC_COLL_TYPE_ALLGATHERV	
UCC_COLL_TYPE_ALLREDUCE	
UCC_COLL_TYPE_ALLTOALL	
UCC_COLL_TYPE_ALLTOALLV	
UCC_COLL_TYPE_BARRIER	
UCC_COLL_TYPE_BCAST	
UCC_COLL_TYPE_FANIN	
UCC_COLL_TYPE_FANOUT	
UCC_COLL_TYPE_GATHER	
UCC_COLL_TYPE_GATHERV	
UCC_COLL_TYPE_REDUCE	
UCC_COLL_TYPE_REDUCE_SCATTER	
UCC_COLL_TYPE_REDUCE_SCATTERV	
UCC_COLL_TYPE_SCATTER	
UCC_COLL_TYPE_SCATTERV	
UCC_COLL_TYPE_LAST	

#### 8.1.4.3 ucc\_datatype\_t

enum [ucc\\_datatype\\_t](#)

Description

[ucc\\_datatype\\_t](#) represents the datatypes supported by the UCC library's collective and reduction operations. The standard operations are signed and unsigned integers of various sizes, float 16, 32, and 64, and user-defined datatypes. The UCC\_DT\_USERDEFINED represents the user-defined datatype. The UCC\_DT\_OPAQUE is used to represent the user-defined datatypes for user-defined reductions. When UCC\_DT\_OPAQUE is used, the library passes the data to the user-defined reductions without any modifications.

Enumerator

UCC_DT_INT8	
-------------	--

Enumerator

UCC_DT_INT16	
UCC_DT_INT32	
UCC_DT_INT64	
UCC_DT_INT128	
UCC_DT_UINT8	
UCC_DT_UINT16	
UCC_DT_UINT32	
UCC_DT_UINT64	
UCC_DT_UINT128	
UCC_DT_FLOAT16	
UCC_DT_FLOAT32	
UCC_DT_FLOAT64	
UCC_DT_USERDEFINED	
UCC_DT_OPAQUE	

#### 8.1.4.4 ucc\_thread\_mode\_t

enum `ucc_thread_mode_t`

Description

`ucc_thread_mode_t` is used to initialize the UCC library's thread mode. The UCC library can be configured in three thread modes `UCC_THREAD_SINGLE`, `UCC_THREAD_FUNNELED`, and `UCC_LIB_THREAD_MULTIPLE`. In the `UCC_THREAD_SINGLE` mode, the user program must not be multithreaded. In the `UCC_THREAD_FUNNELED` mode, the user program may be multithreaded. However, all UCC interfaces should be invoked from the same thread. In the `UCC_THREAD_MULTIPLE` mode, the user program can be multithreaded and any thread may invoke the UCC operations.

Enumerator

UCC_THREAD_SINGLE	Single-threaded library model
UCC_THREAD_FUNNELED	Funnel thread model
UCC_THREAD_MULTIPLE	Multithread library model

#### 8.1.4.5 ucc\_coll\_sync\_type\_t

enum `ucc_coll_sync_type_t`

Description

`ucc_coll_sync_type_t` represents the collective synchronization models. Currently, it supports two synchronization models synchronous and non-synchronous collective models. In the synchronous collective model, the collective communication is not started until participants have not entered the collective operation, and it is not completed until all participants have not completed the collective. In the non-synchronous collective model, collective communication can be started as soon as the participant enters the collective operation and is completed as soon as it completes locally.

Enumerator

UCC_NO_SYNC_COLLECTIVES	Synchornous collectives
UCC_SYNC_COLLECTIVES	Non-synchronous collectives

#### 8.1.4.6 ucc\_lib\_params\_field

enum `ucc_lib_params_field`

Enumerator

UCC_LIB_PARAM_FIELD_THREAD_MODE	
UCC_LIB_PARAM_FIELD_COLL_TYPES	
UCC_LIB_PARAM_FIELD_REDUCTION_TYPES	
UCC_LIB_PARAM_FIELD_SYNC_TYPE	
UCC_LIB_PARAM_FIELD_REDUCTION_WRAPPER	

#### 8.1.4.7 ucc\_lib\_attr\_field

enum `ucc_lib_attr_field`

Enumerator

UCC_LIB_ATTR_FIELD_THREAD_MODE	
UCC_LIB_ATTR_FIELD_COLL_TYPES	
UCC_LIB_ATTR_FIELD_REDUCTION_TYPES	
UCC_LIB_ATTR_FIELD_SYNC_TYPE	

## 8.2 Library initialization and finalization routines

### Functions

- `ucc_status_t ucc_lib_config_read` (const char \*env\_prefix, const char \*filename, `ucc_lib_config_h` \*config)  
*The `ucc_lib_config_read` routine provides a method to read library configuration from the environment and create configuration descriptor.*
- void `ucc_lib_config_release` (`ucc_lib_config_h` config)  
*The `ucc_lib_config_release` routine releases the configuration descriptor.*
- void `ucc_lib_config_print` (const `ucc_lib_config_h` config, FILE \*stream, const char \*title, `ucc_config_print_flags_t` print\_flags)  
*The `ucc_lib_config_print` routine prints the configuration information.*
- `ucc_status_t ucc_lib_config_modify` (`ucc_lib_config_h` config, const char \*name, const char \*value)  
*The `ucc_lib_config_modify` routine modifies the runtime configuration as described by the descriptor.*
- static `ucc_status_t ucc_init` (const `ucc_lib_params_t` \*params, const `ucc_lib_config_h` config, `ucc_lib_h` \*lib\_p)  
*The `ucc_init` initializes the UCC library.*
- `ucc_status_t ucc_finalize` (`ucc_lib_h` lib\_p)  
*The `ucc_finalize` routine finalizes the UCC library.*
- `ucc_status_t ucc_lib_get_attr` (`ucc_lib_h` lib\_p, `ucc_lib_attr_t` \*lib\_attr)  
*The `ucc_lib_get_attr` routine queries the library attributes.*

### 8.2.1 Detailed Description

Library initialization and finalization routines

### 8.2.2 Function Documentation

#### 8.2.2.1 `ucc_lib_config_read()`

```
ucc_status_t ucc_lib_config_read (
    const char * env_prefix,
    const char * filename,
    ucc_lib_config_h * config )
```

Parameters

out	<i>env_prefix</i>	If not NULL, the routine searches for the environment variables with the prefix UCC_<env_prefix>. Otherwise, the routines search for the environment variables that start with the prefix @ UCC_.
in	<i>filename</i>	If not NULL, read configuration values from the file defined by <i>filename</i> . If the file does not exist, it will be ignored and no error will be reported to the user.
out	<i>config</i>	Pointer to configuration descriptor as defined by <code>ucc_lib_config_h</code> .

#### Description

`ucc_lib_config_read` allocates the `ucc_lib_config_h` handle and fetches the configuration values from the run-time environment. The run-time environment supported are environment variables or a configuration file.

Returns

Error code as defined by `ucc_status_t`

### 8.2.2.2 `ucc_lib_config_release()`

```
void ucc_lib_config_release (
    ucc_lib_config_h config )
```

Parameters

in	<i>config</i>	Pointer to the configuration descriptor to be released. Configuration descriptor as defined by <code>ucc_lib_config_h</code> .
----	---------------	--

#### Description

The routine releases the configuration descriptor that was allocated through `ucc_lib_config_read()` routine.

### 8.2.2.3 `ucc_lib_config_print()`

```
void ucc_lib_config_print (
    const ucc_lib_config_h config,
    FILE * stream,
    const char * title,
    ucc_config_print_flags_t print_flags )
```

Parameters

in	<i>config</i>	<code>ucc_lib_config_h</code> "Configuration descriptor" to print.
in	<i>stream</i>	Output stream to print the configuration to.
in	<i>title</i>	Configuration title to print.
in	<i>print_flags</i>	Flags that control various printing options.

#### Description

The routine prints the configuration information that is stored in `ucc_lib_config_h` "configuration" descriptor.

### 8.2.2.4 `ucc_lib_config_modify()`

```
ucc_status_t ucc_lib_config_modify (
    ucc_lib_config_h config,
    const char * name,
    const char * value )
```

Parameters

in	<i>config</i>	Pointer to the configuration descriptor to be modified
in	<i>name</i>	Configuration variable to be modified
in	<i>value</i>	Configuration value to set

#### Description

The `ucc_lib_config_modify` routine sets the value of identifier "name" to "value".

Returns

Error code as defined by `ucc_status_t`

### 8.2.2.5 ucc\_init()

```
static ucc_status_t ucc_init (
    const ucc_lib_params_t * params,
    const ucc_lib_config_h config,
    ucc_lib_h * lib_p ) [inline], [static]
```

Parameters

in	<i>params</i>	user provided parameters to customize the library functionality
in	<i>config</i>	UCC configuration descriptor allocated through <a href="#">ucc_config_read()</a> routine.
out	<i>lib_p</i>	UCC library handle

#### Description

A local operation to initialize and allocate the resources for the UCC operations. The parameters passed using the `ucc_lib_params_t` and `ucc_lib_config_h` structures will customize and select the functionality of the UCC library. The library can be customized for its interaction with the user threads, types of collective operations, and reductions supported. On success, the library object will be created and `ucc_status_t` will return `UCC_OK`. On error, the library object will not be created and corresponding error code as defined by `ucc_status_t` is returned.

Returns

Error code as defined by `ucc_status_t`

### 8.2.2.6 ucc\_finalize()

```
ucc_status_t ucc_finalize (
    ucc_lib_h lib_p )
```

Parameters

in	<i>lib_p</i>	Handle to <code>ucc_lib_h</code> "UCC library".
----	--------------	---

#### Description

A local operation to release the resources and cleanup. All participants that invoked [ucc\\_init](#) should call this routine.

Returns

Error code as defined by `ucc_status_t`

### 8.2.2.7 ucc\_lib\_get\_attr()

```
ucc_status_t ucc_lib_get_attr (
    ucc_lib_h lib_p,
    ucc_lib_attr_t * lib_attr )
```

Parameters

out	<i>lib_attr</i>	Library attributes
in	<i>lib_p</i>	Input library object

#### Description

A query operation to get the attributes of the library object. The attributes are library configured values and reflect the choices made by the library implementation.

Returns

Error code as defined by `ucc_status_t`

## 8.3 Context abstraction data-structures

### Data Structures

- struct [ucc\\_context\\_oob\\_coll](#)  
*OOB collective operation for creating the context.*
- struct [ucc\\_context\\_params](#)  
*Structure representing the parameters to customize the context. [More...](#)*
- struct [ucc\\_context\\_attr](#)  
*Structure representing context attributes. [More...](#)*

### Typedefs

- typedef struct [ucc\\_context\\_oob\\_coll](#) [ucc\\_context\\_oob\\_coll\\_t](#)  
*OOB collective operation for creating the context.*
- typedef struct [ucc\\_context\\_params](#) [ucc\\_context\\_params\\_t](#)  
*Structure representing the parameters to customize the context.*
- typedef struct [ucc\\_context\\_attr](#) [ucc\\_context\\_attr\\_t](#)  
*Structure representing context attributes.*
- typedef struct ucc\_context \* [ucc\\_context\\_h](#)  
*UCC context.*
- typedef struct ucc\_context\_config \* [ucc\\_context\\_config\\_h](#)  
*UCC context configuration handle.*

### Enumerations

- enum [ucc\\_context\\_type\\_t](#) {  
  [UCC\\_CONTEXT\\_EXCLUSIVE](#) = 0,  
  [UCC\\_CONTEXT\\_SHARED](#) }
- enum [ucc\\_context\\_params\\_field](#) {  
  [UCC\\_CONTEXT\\_PARAM\\_FIELD\\_TYPE](#) = UCC\_BIT(0),  
  [UCC\\_CONTEXT\\_PARAM\\_FIELD\\_SYNC\\_TYPE](#) = UCC\_BIT(1),  
  [UCC\\_CONTEXT\\_PARAM\\_FIELD\\_OOB](#) = UCC\_BIT(2),  
  [UCC\\_CONTEXT\\_PARAM\\_FIELD\\_ID](#) = UCC\_BIT(3) }
- enum [ucc\\_context\\_attr\\_field](#) {  
  [UCC\\_CONTEXT\\_ATTR\\_FIELD\\_TYPE](#) = UCC\_BIT(0),  
  [UCC\\_CONTEXT\\_ATTR\\_FIELD\\_SYNC\\_TYPE](#) = UCC\_BIT(1),  
  [UCC\\_CONTEXT\\_ATTR\\_FIELD\\_CTX\\_ADDR](#) = UCC\_BIT(2),  
  [UCC\\_CONTEXT\\_ATTR\\_FIELD\\_CTX\\_ADDR\\_LEN](#) = UCC\_BIT(3) }

#### 8.3.1 Detailed Description

Data-structures associated with context creation and management routines

#### 8.3.2 Data Structure Documentation

##### 8.3.2.1 struct ucc\_context\_params

Description

[ucc\\_context\\_params\\_t](#) defines the parameters that can be used to customize the context. The "mask" bit array fields are defined by [ucc\\_context\\_params\\_field](#). The bits in "mask" bit array is defined by [ucc\\_context\\_params\\_field](#), which correspond to fields in structure [ucc\\_context\\_params\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

Data Fields

uint64_t	mask	
----------	------	--

## Data Fields

<a href="#">ucc_context_type_t</a>	type	
<a href="#">ucc_coll_sync_type_t</a>	sync_type	
<a href="#">ucc_context_oob_coll_t</a>	oob	
<a href="#">uint64_t</a>	ctx_id	

**8.3.2.2 struct ucc\_context\_attr**

## Description

[ucc\\_context\\_attr\\_t](#) defines the attributes of the context. The bits in "mask" bit array is defined by [ucc\\_context\\_attr\\_field](#), which correspond to fields in structure [ucc\\_context\\_attr\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

## Data Fields

<a href="#">uint64_t</a>	mask	
<a href="#">ucc_context_type_t</a>	type	
<a href="#">ucc_coll_sync_type_t</a>	sync_type	
<a href="#">ucc_context_addr_h</a>	ctx_addr	
<a href="#">ucc_context_addr_len_t</a>	ctx_addr_len	

**8.3.3 Typedef Documentation****8.3.3.1 ucc\_context\_oob\_coll\_t**

```
typedef struct ucc_context_oob_coll ucc_context_oob_coll_t
```

**8.3.3.2 ucc\_context\_params\_t**

```
typedef struct ucc_context_params ucc_context_params_t
```

## Description

[ucc\\_context\\_params\\_t](#) defines the parameters that can be used to customize the context. The "mask" bit array fields are defined by [ucc\\_context\\_params\\_field](#). The bits in "mask" bit array is defined by [ucc\\_context\\_params\\_field](#), which correspond to fields in structure [ucc\\_context\\_params\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

**8.3.3.3 ucc\_context\_attr\_t**

```
typedef struct ucc_context_attr ucc_context_attr_t
```

## Description

[ucc\\_context\\_attr\\_t](#) defines the attributes of the context. The bits in "mask" bit array is defined by [ucc\\_context\\_attr\\_field](#), which correspond to fields in structure [ucc\\_context\\_attr\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

**8.3.3.4 ucc\_context\_h**

```
typedef struct ucc_context* ucc_context_h
```

The UCC context is an opaque handle to abstract the network resources for collective operations. The network resources could be either software or hardware. Based on the type of the context, the resources can be shared or either be exclusively used. The UCC context is required but not sufficient to execute a collective operation.

### 8.3.3.5 ucc\_context\_config\_h

```
typedef struct ucc_context_config* ucc_context_config_h
```

## 8.3.4 Enumeration Type Documentation

### 8.3.4.1 ucc\_context\_type\_t

```
enum ucc_context_type_t
```

Enumerator

UCC_CONTEXT_EXCLUSIVE	
UCC_CONTEXT_SHARED	

### 8.3.4.2 ucc\_context\_params\_field

```
enum ucc_context_params_field
```

Enumerator

UCC_CONTEXT_PARAM_FIELD_TYPE	
UCC_CONTEXT_PARAM_FIELD_SYNC_TYPE	
UCC_CONTEXT_PARAM_FIELD_OOB	
UCC_CONTEXT_PARAM_FIELD_ID	

### 8.3.4.3 ucc\_context\_attr\_field

```
enum ucc_context_attr_field
```

Enumerator

UCC_CONTEXT_ATTR_FIELD_TYPE	
UCC_CONTEXT_ATTR_FIELD_SYNC_TYPE	
UCC_CONTEXT_ATTR_FIELD_CTX_ADDR	
UCC_CONTEXT_ATTR_FIELD_CTX_ADDR_LEN	

## 8.4 Context abstraction routines

### Functions

- `ucc_status_t ucc_context_config_read (ucc_lib_h lib_handle, const char *filename, ucc_context_config_h *config)`  
*Routine reads the configuration information for contexts from the runtime environment and creates the configuration descriptor.*
- `void ucc_context_config_release (ucc_context_config_h config)`  
*The `ucc_context_config_release` routine releases the configuration descriptor.*
- `void ucc_context_config_print (const ucc_context_config_h config, FILE *stream, const char *title, ucc_config_print_flags_t print_flags)`  
*The `ucc_context_config_print` routine prints the configuration information.*
- `ucc_status_t ucc_context_config_modify (ucc_context_config_h config, const char *cls, const char *name, const char *value)`  
*The `ucc_context_config_modify` routine modifies the runtime configuration of UCC context (optionally for a given CLS)*
- `ucc_status_t ucc_context_create (ucc_lib_h lib_handle, const ucc_context_params_t *params, const ucc_context_config_h config, ucc_context_h *context)`  
*The `ucc_context_create` routine creates the context handle.*
- `ucc_status_t ucc_context_progress (ucc_context_h context)`  
*The `ucc_context_progress` routine progresses the operations on the context handle.*
- `ucc_status_t ucc_context_destroy (ucc_context_h context)`  
*The `ucc_context_destroy` routine frees the context handle.*
- `ucc_status_t ucc_context_get_attr (ucc_context_h context, ucc_context_attr_t *context_attr)`  
*The routine queries the attributes of the context handle.*

### 8.4.1 Detailed Description

Context create and management routines

### 8.4.2 Function Documentation

#### 8.4.2.1 ucc\_context\_config\_read()

```
ucc_status_t ucc_context_config_read (
    ucc_lib_h lib_handle,
    const char * filename,
    ucc_context_config_h * config )
```

Parameters

in	<i>lib_handle</i>	Library handle
in	<i>filename</i>	If not NULL, read configuration values from the file defined by <i>filename</i> . If the file does not exist, it will be ignored and no error will be reported to the user.
out	<i>config</i>	Pointer to configuration descriptor as defined by <code>ucc_context_config_h</code> .

#### Description

`ucc_context_config_read` allocates the `ucc_lib_config_h` handle and fetches the configuration values from the run-time environment. The run-time environment supported are environment variables or a configuration file. It uses the `env_prefix` from `ucc_lib_config_read`. If `env_prefix` is not NULL, the routine searches for the environment variables with the prefix `UCC_<env_prefix>`. Otherwise, the routines search for the environment variables that start with the prefix `@ UCC_`.

Returns

Error code as defined by `ucc_status_t`

#### 8.4.2.2 `ucc_context_config_release()`

```
void ucc_context_config_release (
    ucc_context_config_h config )
```

Parameters

in	<i>config</i>	Pointer to the configuration descriptor to be released. Configuration descriptor as defined by <code>ucc_context_config_h</code>
----	---------------	--

#### Description

The routine releases the configuration descriptor that was allocated through `ucc_context_config_read()` routine.

#### 8.4.2.3 `ucc_context_config_print()`

```
void ucc_context_config_print (
    const ucc_context_config_h config,
    FILE * stream,
    const char * title,
    ucc_config_print_flags_t print_flags )
```

Parameters

in	<i>config</i>	<code>ucc_context_config_h</code> "Configuration descriptor" to print.
in	<i>stream</i>	Output stream to print the configuration to.
in	<i>title</i>	Configuration title to print.
in	<i>print_flags</i>	Flags that control various printing options.

#### Description

The routine prints the configuration information that is stored in `ucc_context_config_h` "configuration" descriptor.

#### 8.4.2.4 `ucc_context_config_modify()`

```
ucc_status_t ucc_context_config_modify (
    ucc_context_config_h config,
    const char * cls,
    const char * name,
    const char * value )
```

Parameters

in	<i>config</i>	Pointer to the configuration descriptor to be modified
in	<i>cls</i>	Comma separated list of CLS or NULL. If NULL then core context config is modified.
in	<i>name</i>	Configuration variable to be modified
in	<i>value</i>	Configuration value to set

#### Description

The `ucc_context_config_modify` routine sets the value of identifier "name" to "value" for a specified CL.

Returns

Error code as defined by `ucc_status_t`

#### 8.4.2.5 `ucc_context_create()`

```
ucc_status_t ucc_context_create (
    ucc_lib_h lib_handle,
    const ucc_context_params_t * params,
    const ucc_context_config_h config,
    ucc_context_h * context )
```

Parameters

in	<i>lib_handle</i>	Library handle
out	<i>params</i>	Customizations for the communication context
out	<i>config</i>	Configuration for the communication context to read from environment
out	<i>context</i>	Pointer to the newly created communication context

#### Description

The `ucc_context_create` creates the context and `ucc_context_destroy` releases the resources and destroys the context state. The creation of context does not necessarily indicate its readiness to be used for collective or other group operations. On success, the context handle will be created and `ucc_status_t` will return `UCC_OK`. On error, the library object will not be created and corresponding error code as defined by `ucc_status_t` is returned.

Returns

Error code as defined by `ucc_status_t`

#### 8.4.2.6 `ucc_context_progress()`

```
ucc_status_t ucc_context_progress (
    ucc_context_h context )
```

Parameters

in	<i>context</i>	Communication context handle to be progressed
<b>Description</b> <code>ucc_context_progress</code> routine progresses the operations on the content handle. It does not block for lack of resources or communication.		

Returns

Error code as defined by `ucc_status_t`

#### 8.4.2.7 `ucc_context_destroy()`

```
ucc_status_t ucc_context_destroy (
    ucc_context_h context )
```

Parameters

in	<i>context</i>	Communication context handle to be released
----	----------------	---

**Description**

[ucc\\_context\\_destroy](#) routine releases the resources associated with the handle *context*. All teams associated with the team should be released before this. It is invalid to associate any team with this handle after the routine is called.

Returns

Error code as defined by `ucc_status_t`

**8.4.2.8 ucc\_context\_get\_attr()**

```
ucc_status_t ucc_context_get_attr (
    ucc_context_h context,
    ucc_context_attr_t * context_attr )
```

Parameters

in	<i>context</i>	Communication context
out	<i>context_attr</i>	Attributes of the communication context

**Description**

[ucc\\_context\\_get\\_attr](#) routine queries the context handle attributes described by [ucc\\_context\\_attr](#).

Returns

Error code as defined by `ucc_status_t`

## 8.5 Team abstraction data-structures

### Data Structures

- struct `ucc_mem_map_params`
- struct `ucc_team_p2p_conn`
- struct `ucc_team_oob_coll`
- struct `ucc_ep_map_strided`
- struct `ucc_ep_map_array`
- struct `ucc_ep_map_cb`
- struct `ucc_ep_map_t`
- union `ucc_ep_map_t.__unnamed__`
- struct `ucc_team_params`

*Structure representing the parameters to customize the team. [More...](#)*

- struct `ucc_team_attr`

*Structure representing the team attributes. [More...](#)*

### Typedefs

- typedef struct `ucc_mem_map_params` `ucc_mem_map_params_t`
- typedef struct `ucc_team_p2p_conn` `ucc_team_p2p_conn_t`
- typedef struct `ucc_team_oob_coll` `ucc_team_oob_coll_t`
- typedef struct `ucc_ep_map_t` `ucc_ep_map_t`
- typedef struct `ucc_team_params` `ucc_team_params_t`

*Structure representing the parameters to customize the team.*

- typedef struct `ucc_team_attr` `ucc_team_attr_t`

*Structure representing the team attributes.*

- typedef struct `ucc_team` \* `ucc_team_h`

*UCC team handle.*

- typedef void \* `ucc_p2p_conn_t`
- typedef void \* `ucc_context_addr_h`
- typedef size\_t `ucc_context_addr_len_t`

### Enumerations

- enum `ucc_team_params_field` {

### 8.5.1 Detailed Description

Data-structures associated with team create and management routines

### 8.5.2 Data Structure Documentation

#### 8.5.2.1 struct `ucc_mem_map_params`

Data Fields

<code>void *</code>	address	
<code>size_t</code>	len	
<code>ucc_mem_hints_t</code>	hints	
<code>ucc_mem_constraints_t</code>	constraints	

#### 8.5.2.2 struct `ucc_ep_map_strided`

Data Fields

<code>uint64_t</code>	start	
<code>uint64_t</code>	stride	

#### 8.5.2.3 struct `ucc_ep_map_array`

Data Fields

<code>void *</code>	map	
<code>size_t</code>	elem_size	4 if array is int, 8 if e.g. <code>uint64_t</code>

#### 8.5.2.4 struct `ucc_ep_map_t`

Data Fields

<code>ucc_ep_map_type_t</code>	type	
--------------------------------	------	--

## Data Fields

uint64_t	ep_num	number of eps mapped to ctx
union <a href="#">ucc_ep_map_t</a>	__unnamed__	

8.5.2.5 union [ucc\\_ep\\_map\\_t](#). \_\_unnamed\_\_

## Data Fields

struct <a href="#">ucc_ep_map_strided</a>	strided	
struct <a href="#">ucc_ep_map_array</a>	array	
struct <a href="#">ucc_ep_map_cb</a>	cb	

8.5.2.6 struct [ucc\\_team\\_params](#)

## Description

[ucc\\_team\\_params\\_t](#) defines the parameters that can be used to customize the team. The "mask" bit array fields are defined by [ucc\\_team\\_params\\_field](#). The bits in "mask" bit array is defined by [ucc\\_team\\_params\\_field](#), which correspond to fields in structure [ucc\\_team\\_params\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

## Data Fields

uint64_t	mask	
<a href="#">ucc_post_ordering_t</a>	ordering	
uint64_t	outstanding_colls	
uint64_t	ep	
uint64_t *	ep_list	
<a href="#">ucc_ep_range_type_t</a>	ep_range	
uint64_t	team_size	
<a href="#">ucc_coll_sync_type_t</a>	sync_type	
<a href="#">ucc_team_oob_coll_t</a>	oob	
<a href="#">ucc_team_p2p_conn_t</a>	p2p_conn	
<a href="#">ucc_mem_map_params_t</a>	mem_params	
<a href="#">ucc_ep_map_t</a>	ep_map	
uint64_t	id	

8.5.2.7 struct [ucc\\_team\\_attr](#)

## Description

[ucc\\_team\\_attr\\_t](#) defines the attributes of the team. The bits in "mask" bit array is defined by [ucc\\_team\\_attr\\_field](#), which correspond to fields in structure [ucc\\_team\\_attr\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

## Data Fields

uint64_t	mask	
<a href="#">ucc_post_ordering_t</a>	ordering	
uint64_t	outstanding_colls	
uint64_t	ep	
<a href="#">ucc_ep_range_type_t</a>	ep_range	

Data Fields

<a href="#">ucc_coll_sync_type_t</a>	sync_type	
<a href="#">ucc_mem_map_params_t</a>	mem_params	

### 8.5.3 Typedef Documentation

#### 8.5.3.1 [ucc\\_mem\\_map\\_params\\_t](#)

```
typedef struct ucc\_mem\_map\_params ucc\_mem\_map\_params\_t
```

#### 8.5.3.2 [ucc\\_team\\_p2p\\_conn\\_t](#)

```
typedef struct ucc\_team\_p2p\_conn ucc\_team\_p2p\_conn\_t
```

#### 8.5.3.3 [ucc\\_team\\_oob\\_coll\\_t](#)

```
typedef struct ucc\_team\_oob\_coll ucc\_team\_oob\_coll\_t
```

#### 8.5.3.4 [ucc\\_ep\\_map\\_t](#)

```
typedef struct ucc\_ep\_map\_t ucc\_ep\_map\_t
```

#### 8.5.3.5 [ucc\\_team\\_params\\_t](#)

```
typedef struct ucc\_team\_params ucc\_team\_params\_t
```

Description

[ucc\\_team\\_params\\_t](#) defines the parameters that can be used to customize the team. The "mask" bit array fields are defined by [ucc\\_team\\_params\\_field](#). The bits in "mask" bit array is defined by [ucc\\_team\\_params\\_field](#), which correspond to fields in structure [ucc\\_team\\_params\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

#### 8.5.3.6 [ucc\\_team\\_attr\\_t](#)

```
typedef struct ucc\_team\_attr ucc\_team\_attr\_t
```

Description

[ucc\\_team\\_attr\\_t](#) defines the attributes of the team. The bits in "mask" bit array is defined by [ucc\\_team\\_attr\\_field](#), which correspond to fields in structure [ucc\\_team\\_attr\\_t](#). The valid fields of the structure is specified by the setting the bit to "1" in the bit-array "mask". When bits corresponding to the fields is not set, the fields are not defined.

#### 8.5.3.7 [ucc\\_team\\_h](#)

```
typedef struct ucc\_team* ucc\_team\_h
```

The UCC team handle is an opaque handle created by the library. It abstracts the group resources required for the collective operations and participants of the collective operation. The participants of the collective operation can be an OS process or thread.

**8.5.3.8 ucc\_p2p\_conn\_t**

```
typedef void* ucc_p2p_conn_t
```

**8.5.3.9 ucc\_context\_addr\_h**

```
typedef void* ucc_context_addr_h
```

**8.5.3.10 ucc\_context\_addr\_len\_t**

```
typedef size_t ucc_context_addr_len_t
```

**8.5.4 Enumeration Type Documentation****8.5.4.1 ucc\_team\_params\_field**

```

Enumerator

UCC_MEM_HINT_REMOTE_ATOMICS	
UCC_MEM_HINT_REMOTE_COUNTERS	

**8.5.4.5 ucc\_post\_ordering\_t**enum `ucc_post_ordering_t`

Enumerator

UCC_COLLECTIVE_POST_ORDERED	
UCC_COLLECTIVE_POST_UNORDERED	

**8.5.4.6 ucc\_ep\_range\_type\_t**enum `ucc_ep_range_type_t`

Enumerator

UCC_COLLECTIVE_EP_RANGE_CONTIG	
UCC_COLLECTIVE_EP_RANGE_NONCONTIG	

**8.5.4.7 ucc\_ep\_map\_type\_t**enum `ucc_ep_map_type_t`

Enumerator

UCC_EP_MAP_FULL	The ep range of the team spans all eps from a context
UCC_EP_MAP_STRIDED	The ep range of the team can be described by the 2 values: start, stride.
UCC_EP_MAP_ARRAY	The ep range is given as an array of intergers that map the ep in the team to the team_context rank.
UCC_EP_MAP_CB	The ep range mapping is defined as callback provided by the UCC user.

## 8.6 Team abstraction routines

### Functions

- `ucc_status_t ucc_team_create_post (ucc_context_h *contexts, uint32_t num_contexts, const ucc_team_params_t *team_params, ucc_team_h *new_team)`  
The routine is a method to create the team.
- `ucc_status_t ucc_team_create_test (ucc_team_h team)`  
The routine queries the status of the team creation operation.
- `ucc_status_t ucc_team_destroy (ucc_team_h team)`  
The team frees the team handle.
- `ucc_status_t ucc_team_get_attr (ucc_team_h team, ucc_team_attr_t *team_attr)`  
The routine returns the attributes of the team.
- `ucc_status_t ucc_team_create_from_parent (uint64_t my_ep, uint32_t included, ucc_team_h parent_team, ucc_team_h *new_team)`  
The routine creates a new team from the parent team.
- `ucc_status_t ucc_team_get_size (ucc_team_h team, uint32_t *size)`  
The routine returns the size of the team.
- `ucc_status_t ucc_team_get_my_ep (ucc_team_h team, uint64_t *ep)`  
The routine returns the endpoint of the calling participant.
- `ucc_status_t ucc_team_get_all_eps (ucc_team_h team, uint64_t **ep, uint64_t *num_eps)`  
The routine queries all endpoints associated with the team handle.

### 8.6.1 Detailed Description

Team create and management routines

### 8.6.2 Function Documentation

#### 8.6.2.1 ucc\_team\_create\_post()

```
ucc_status_t ucc_team_create_post (
    ucc_context_h * contexts,
    uint32_t num_contexts,
    const ucc_team_params_t * team_params,
    ucc_team_h * new_team )
```

Parameters

in	<i>contexts</i>	Communication contexts abstracting the resources
in	<i>num_contexts</i>	Number of contexts passed for the create operation
in	<i>team_params</i>	User defined configurations for the team
out	<i>new_team</i>	Team handle

#### Description

`ucc_team_create_post` is a nonblocking collective operation to create the team handle. It takes in parameters `ucc_context_h` and `ucc_team_params_t`. The `ucc_team_params_t` provides user configuration to customize the team and, `ucc_context_h` provides the resources for the team and collectives. The routine returns immediately after posting the operation with the new team handle. However, the team handle is not ready for posting the collective operation. `ucc_team_create_test` operation is used to learn the status of the new team handle. On error, the team handle will not be created and corresponding error code as defined by `ucc_status_t` is returned.

Returns

Error code as defined by `ucc_status_t`

### 8.6.2.2 `ucc_team_create_test()`

```
ucc_status_t ucc_team_create_test (
    ucc_team_h team )
```

Parameters

in	<i>team</i>	Team handle to test
----	-------------	---------------------

#### Description

`ucc_team_create_test` routines tests the status of team handle. If required it can progress the communication but cannot block on the communications.

Returns

Error code as defined by `ucc_status_t`

### 8.6.2.3 `ucc_team_destroy()`

```
ucc_status_t ucc_team_destroy (
    ucc_team_h team )
```

Parameters

in	<i>team</i>	Destroy previously created team and release all resources associated with it.
----	-------------	---

#### Description

`ucc_team_destroy` is a nonblocking collective operation to release all resources associated with the team handle, and destroy the team handle. It is invalid to post a collective operation after the `ucc_team_destroy` operation. It is invalid to call `ucc_team_destroy` operation while `ucc_team_create_post` is in progress. It is the user's responsibility to ensure there is one outstanding `ucc_team_create_post` or `ucc_team_destroy` operation is in progress.

Returns

Error code as defined by `ucc_status_t`

### 8.6.2.4 `ucc_team_get_attr()`

```
ucc_status_t ucc_team_get_attr (
    ucc_team_h team,
    ucc_team_attr_t * team_attr )
```

Parameters

in	<i>team</i>	Team handle
out	<i>team_attr</i>	Attributes of the team

#### Description

`ucc_team_get_attr` routine queries the team handle attributes. The attributes of the team handle are described by the team attributes `ucc_team_attr_t`

Returns

Error code as defined by `ucc_status_t`

#### 8.6.2.5 `ucc_team_create_from_parent()`

```
ucc_status_t ucc_team_create_from_parent (
    uint64_t my_ep,
    uint32_t included,
    ucc_team_h parent_team,
    ucc_team_h * new_team )
```

Parameters

in	<i>my_ep</i>	Endpoint of the process/thread calling the split operation
in	<i>parent_team</i>	Parent team handle from which a new team handle is created
in	<i>included</i>	Variable indicating whether a process/thread participates in the newly created team; value 1 indicates the participation and value 0 indicates otherwise
out	<i>new_team</i>	Pointer to the new team handle

#### Description

`ucc_team_create_from_parent` is a nonblocking collective operation, which creates a new team from the parent team. If a participant intends to participate in the new team, it passes a TRUE value for the "included" parameter. Otherwise, it passes FALSE. The routine returns immediately after the post-operation. To learn the completion of the team create operation, the `ucc_team_create_test` operation is used.

Returns

Error code as defined by `ucc_status_t`

#### 8.6.2.6 `ucc_team_get_size()`

```
ucc_status_t ucc_team_get_size (
    ucc_team_h team,
    uint32_t * size )
```

Parameters

in	<i>team</i>	Team handle
out	<i>size</i>	The size of team as number of endpoints

#### Description

`ucc_team_get_size` routine queries the size of the team. It reflects the number of unique endpoints in the team.

Returns

Error code as defined by `ucc_status_t`

#### 8.6.2.7 `ucc_team_get_my_ep()`

```
ucc_status_t ucc_team_get_my_ep (
    ucc_team_h team,
    uint64_t * ep )
```

## Parameters

out	<i>ep</i>	Endpoint of the participant calling the routine
in	<i>team</i>	Team handle

**Description**

`ucc_team_get_my_ep` routine queries and returns the endpoint of the participant invoking the interface.

## Returns

Error code as defined by `ucc_status_t`

**8.6.2.8 `ucc_team_get_all_eps()`**

```
ucc_status_t ucc_team_get_all_eps (
    ucc_team_h team,
    uint64_t ** ep,
    uint64_t * num_eps )
```

## Parameters

out	<i>ep</i>	List of endpoints
out	<i>num_eps</i>	Number of endpoints
in	<i>team</i>	Team handle

**Description**

`ucc_team_get_all_eps` routine queries and returns all endpoints of all participants in the team.

## Returns

Error code as defined by `ucc_status_t`

## 8.7 Collective operations data-structures

### Data Structures

- struct `ucc_coll_buffer_info_v`
- struct `ucc_coll_buffer_info`
- struct `ucc_coll_callback`

*UCC collective completion callback.*

### Typedefs

- typedef enum `ucc_memory_type` `ucc_memory_type_t`
- typedef struct `ucc_coll_buffer_info_v` `ucc_coll_buffer_info_v_t`
- typedef struct `ucc_coll_buffer_info` `ucc_coll_buffer_info_t`
- typedef struct `ucc_coll_req` \* `ucc_coll_req_h`  
*UCC collective request handle.*
- typedef struct `ucc_coll_callback` `ucc_coll_callback_t`  
*UCC collective completion callback.*
- typedef uint64\_t `ucc_count_t`  
*Count datatype to support both small (32 bit) and large counts (64 bit)*
- typedef uint64\_t `ucc_aaint_t`  
*Datatype to support both small (32 bit) and large address offsets (64 bit)*
- typedef uint16\_t `ucc_coll_id_t`  
*Datatype for collective tags.*

### Enumerations

- enum `ucc_coll_args_flags_t` {  
`UCC_COLL_ARGS_FLAG_IN_PLACE` = `UCC_BIT(0)`,  
`UCC_COLL_ARGS_FLAG_PERSISTENT` = `UCC_BIT(1)`,  
`UCC_COLL_ARGS_FLAG_COUNT_64BIT` = `UCC_BIT(2)`,  
`UCC_COLL_ARGS_FLAG_DISPLACEMENTS_64BIT` = `UCC_BIT(3)`,  
`UCC_COLL_ARGS_FLAG_CONTIG_SRC_BUFFER` = `UCC_BIT(4)`,  
`UCC_COLL_ARGS_FLAG_CONTIG_DST_BUFFER` = `UCC_BIT(5)` }
- enum `ucc_memory_type` {  
`UCC_MEMORY_TYPE_HOST`,  
`UCC_MEMORY_TYPE_CUDA`,  
`UCC_MEMORY_TYPE_CUDA_MANAGED`,  
`UCC_MEMORY_TYPE_ROCM`,  
`UCC_MEMORY_TYPE_ROCM_MANAGED`,  
`UCC_MEMORY_TYPE_LAST`,  
`UCC_MEMORY_TYPE_UNKNOWN` = `UCC_MEMORY_TYPE_LAST` }
- enum `ucc_error_type_t` {  
`UCC_ERR_TYPE_LOCAL` = 0,  
`UCC_ERR_TYPE_GLOBAL` = 1 }
- enum `ucc_coll_args_field` {  
`UCC_COLL_ARGS_FIELD_FLAGS` = `UCC_BIT(0)`,  
`UCC_COLL_ARGS_FIELD_PREDEFINED_REDUCTIONS` = `UCC_BIT(1)`,  
`UCC_COLL_ARGS_FIELD_USERDEFINED_REDUCTIONS` = `UCC_BIT(2)`,  
`UCC_COLL_ARGS_FIELD_TAG` = `UCC_BIT(3)`,  
`UCC_COLL_ARGS_FIELD_CB` = `UCC_BIT(4)` }

#### 8.7.1 Detailed Description

Data-structures associated with collective operation creation, progress, and finalize.

## 8.7.2 Data Structure Documentation

### 8.7.2.1 struct ucc\_coll\_buffer\_info\_v

Data Fields

void *	buffer	Starting address of the send/recv buffer
ucc_count_t *	counts	Array of counts of type <a href="#">ucc_count_t</a> describing the total number of elements
ucc_aint_t *	displacements	Displacement array of team size and type <a href="#">ucc_aint_t</a> . Entry i specifies the displacement relative to the start address for the incoming data( outgoing data) for the team member i. For send buffer the data is fetched from this displacement and for receive buffer the incoming data is placed at this displacement.
ucc_datatype_t	datatype	Datatype of each buffer element
ucc_memory_type_t	mem_type	Memory type of buffer as defined by <a href="#">ucc_memory_type</a>

### 8.7.2.2 struct ucc\_coll\_buffer\_info

Data Fields

void *	buffer	Starting address of the send/recv buffer
ucc_count_t	count	Total number of elements in the buffer
ucc_datatype_t	datatype	Datatype of each buffer element
ucc_memory_type_t	mem_type	Memory type of buffer as defined by <a href="#">ucc_memory_type</a>

## 8.7.3 Typedef Documentation

### 8.7.3.1 ucc\_memory\_type\_t

```
typedef enum ucc_memory_type ucc_memory_type_t
```

### 8.7.3.2 ucc\_coll\_buffer\_info\_v\_t

```
typedef struct ucc_coll_buffer_info_v ucc_coll_buffer_info_v_t
```

### 8.7.3.3 ucc\_coll\_buffer\_info\_t

```
typedef struct ucc_coll_buffer_info ucc_coll_buffer_info_t
```

### 8.7.3.4 ucc\_coll\_req\_h

```
typedef struct ucc_coll_req* ucc_coll_req_h
```

The UCC request handle is an opaque handle created by the library during the invocation of the collective operation. The request may be used to learn the status of the collective operation, progress, or complete the collective operation.

### 8.7.3.5 ucc\_coll\_callback\_t

```
typedef struct ucc_coll_callback ucc_coll_callback_t
```

The callback is invoked whenever the collective operation is completed. It is not allowed to call UCC APIs from the completion callback except for [ucc\\_collective\\_finalize](#).

**8.7.3.6 ucc\_count\_t**

```
typedef uint64_t ucc_count_t
```

**8.7.3.7 ucc\_aint\_t**

```
typedef uint64_t ucc_aint_t
```

**8.7.3.8 ucc\_coll\_id\_t**

```
typedef uint16_t ucc_coll_id_t
```

**8.7.4 Enumeration Type Documentation****8.7.4.1 ucc\_coll\_args\_flags\_t**

```
enum ucc_coll_args_flags_t
```

Enumerator

UCC_COLL_ARGS_FLAG_IN_PLACE	
UCC_COLL_ARGS_FLAG_PERSISTENT	
UCC_COLL_ARGS_FLAG_COUNT_64BIT	
UCC_COLL_ARGS_FLAG_DISPLACEMENTS_64BIT	
UCC_COLL_ARGS_FLAG_CONTIG_SRC_BUFFER	
UCC_COLL_ARGS_FLAG_CONTIG_DST_BUFFER	

**8.7.4.2 ucc\_memory\_type**

```
enum ucc_memory_type
```

Enumerator

UCC_MEMORY_TYPE_HOST	Default system memory
UCC_MEMORY_TYPE_CUDA	NVIDIA CUDA memory
UCC_MEMORY_TYPE_CUDA_MANAGED	NVIDIA CUDA managed memory
UCC_MEMORY_TYPE_ROCM	AMD ROCM memory
UCC_MEMORY_TYPE_ROCM_MANAGED	AMD ROCM managed system memory
UCC_MEMORY_TYPE_LAST	
UCC_MEMORY_TYPE_UNKNOWN	

**8.7.4.3 ucc\_error\_type\_t**

```
enum ucc_error_type_t
```

Enumerator

UCC_ERR_TYPE_LOCAL	
UCC_ERR_TYPE_GLOBAL	

#### 8.7.4.4 ucc\_coll\_args\_field

enum `ucc_coll_args_field`

Enumerator

UCC_COLL_ARGS_FIELD_FLAGS	
UCC_COLL_ARGS_FIELD_PREDEFINED_REDUCTIONS	
UCC_COLL_ARGS_FIELD_USERDEFINED_REDUCTIONS	
UCC_COLL_ARGS_FIELD_TAG	
UCC_COLL_ARGS_FIELD_CB	

## 8.8 Collective Operations

### Data Structures

- struct `ucc_coll_args`  
*Structure representing arguments for the collective operations. [More...](#)*
- union `ucc_coll_args.src`
- union `ucc_coll_args.dst`
- struct `ucc_coll_args.reduce`

### Typedefs

- typedef void(\* `ucc_reduction_wrapper_t`) (void \*invec, void \*inoutvec, `ucc_count_t` \*count, void \*dtype, void \*custom\_reduction\_op)  
*The reduction wrapper provides an interface for the UCC library to invoke user-defined custom reduction callback.*
- typedef struct `ucc_coll_args` `ucc_coll_args_t`  
*Structure representing arguments for the collective operations.*
- typedef struct `ucc_mem_handle` \* `ucc_mem_h`  
*UCC memory handle.*

### Functions

- `ucc_status_t` `ucc_collective_init` (`ucc_coll_args_t` \*coll\_args, `ucc_coll_req_h` \*request, `ucc_team_h` team)  
*The routine to initialize a collective operation.*
- `ucc_status_t` `ucc_collective_post` (`ucc_coll_req_h` request)  
*The routine to post a collective operation.*
- `ucc_status_t` `ucc_collective_init_and_post` (`ucc_coll_args_t` \*coll\_args, `ucc_coll_req_h` \*request, `ucc_team_h` team)  
*The routine to initialize and post a collective operation.*
- static `ucc_status_t` `ucc_collective_test` (`ucc_coll_req_h` request)  
*The routine to query the status of the collective operation.*
- `ucc_status_t` `ucc_collective_finalize` (`ucc_coll_req_h` request)  
*The routine to release the collective operation associated with the request object.*

#### 8.8.1 Detailed Description

Collective operations invocation and progress

#### 8.8.2 Data Structure Documentation

##### 8.8.2.1 struct `ucc_coll_args`

##### Description

`ucc_coll_args_t` defines the parameters that can be used to customize the collective operation. The "mask" bit array fields are defined by `ucc_coll_args_field`. The bits in "mask" bit array is defined by `ucc_coll_args_field`, which correspond to fields in structure `ucc_coll_args_t`. The valid fields of the structure are specified by setting the corresponding bit to "1" in the bit-array "mask".

The collective operation is selected by field "coll\_type" which must be always set by user. If allreduce or \* reduce operation is selected, the type of reduction is selected by the field \* "predefined\_reduction\_op" or "custom\_reduction\_op". For unordered collective operations, the user-provided "tag" value orders the collective operation. For rooted collective operations such as reduce, scatter, gather, fan-in, and fan-out, the "root" field must be provided by user and specify the participant endpoint value. The user can request either "local" or "global" error information using the "error\_type" field.

Information about user buffers used for collective operation must be specified according to the "coll\_type".

Data Fields

uint64_t	mask	
ucc_coll_type_t	coll_type	Type of collective operation
union ucc_coll_args	src	
union ucc_coll_args	dst	
struct ucc_coll_args	reduce	
uint64_t	flags	
uint64_t	root	Root endpoint for rooted collectives
ucc_error_type_t	error_type	Error type
ucc_coll_id_t	tag	Used for ordering collectives
ucc_coll_callback_t	cb	

#### 8.8.2.2 union ucc\_coll\_args.src

Data Fields

ucc_coll_buffer_info_t	info	Buffer info for the collective
ucc_coll_buffer_info_v_t	info_v	Buffer info for the collective

#### 8.8.2.3 union ucc\_coll\_args.dst

Data Fields

ucc_coll_buffer_info_t	info	Buffer info for the collective
ucc_coll_buffer_info_v_t	info_v	Buffer info for the collective

#### 8.8.2.4 struct ucc\_coll\_args.reduce

Data Fields

ucc_reduction_op_t	predefined_op	Reduction operation, if reduce or all-reduce operation selected
void *	custom_op	User defined reduction operation
void *	custom_dtype	

### 8.8.3 Typedef Documentation

#### 8.8.3.1 ucc\_reduction\_wrapper\_t

```
typedef void(* ucc_reduction_wrapper_t) (void *invec, void *inoutvec, ucc_count_t *count, void *dtype, void *custom_reduction_op)
```

Parameters

in	invec	The input elements to be reduced by the user function
----	-------	---

## Parameters

in	<i>inoutvec</i>	The input elements to be reduced and output of the reduction
in	<i>count</i>	The number of elements of type "dtype" to be reduced
in	<i>dtype</i>	Datatype specified in the coll_args
in	<i>custom_op</i>	A pointer to the user defined reduction passed to the coll_args as custom_reduction_op

**Description**

This function is called by the UCC library when it needs to perform a non-standard user-defined reduction operation during allreduce/reduce collective.

**8.8.3.2 ucc\_coll\_args\_t**

```
typedef struct ucc_coll_args ucc_coll_args_t
```

**Description**

`ucc_coll_args_t` defines the parameters that can be used to customize the collective operation. The "mask" bit array fields are defined by `ucc_coll_args_field`. The bits in "mask" bit array is defined by `ucc_coll_args_field`, which correspond to fields in structure `ucc_coll_args_t`. The valid fields of the structure are specified by setting the corresponding bit to "1" in the bit-array "mask".

The collective operation is selected by field "coll\_type" which must be always set by user. If allreduce or \* reduce operation is selected, the type of reduction is selected by the field \* "predefined\_reduction\_op" or "custom\_reduction\_op". For unordered collective operations, the user-provided "tag" value orders the collective operation. For rooted collective operations such as reduce, scatter, gather, fan-in, and fan-out, the "root" field must be provided by user and specify the participant endpoint value. The user can request either "local" or "global" error information using the "error\_type" field.

Information about user buffers used for collective operation must be specified according to the "coll\_type".

**8.8.3.3 ucc\_mem\_h**

```
typedef struct ucc_mem_handle* ucc_mem_h
```

The UCC memory handle is an opaque handle created by the library representing the buffer and address.

**8.8.4 Function Documentation****8.8.4.1 ucc\_collective\_init()**

```
ucc_status_t ucc_collective_init (
    ucc_coll_args_t * coll_args,
    ucc_coll_req_h * request,
    ucc_team_h team )
```

## Parameters

out	<i>request</i>	Request handle representing the collective operation
in	<i>coll_args</i>	Collective arguments descriptor
in	<i>team</i>	Team handle

**Description**

`ucc_collective_init` is a collective initialization operation, where all participants participate. The user provides

all information required to start and complete the collective operation, which includes the input and output buffers, operation type, team handle, size, and any other hints for optimization. On success, the request handle is created and returned. On error, the request handle is not created and the appropriate error code is returned. On return, the ownership of buffers is transferred to the user. If modified, the results of collective operations posted on the request handle are undefined.

Returns

Error code as defined by `ucc_status_t`

#### 8.8.4.2 `ucc_collective_post()`

```
ucc_status_t ucc_collective_post (
    ucc_coll_req_h request )
```

Parameters

in	<i>request</i>	Request handle
----	----------------	----------------

##### Description

`ucc_collective_post` routine posts the collective operation. It does not require synchronization between the participants for the post operation.

Returns

Error code as defined by `ucc_status_t`

#### 8.8.4.3 `ucc_collective_init_and_post()`

```
ucc_status_t ucc_collective_init_and_post (
    ucc_coll_args_t * coll_args,
    ucc_coll_req_h * request,
    ucc_team_h team )
```

Parameters

out	<i>request</i>	Request handle representing the collective operation
in	<i>coll_args</i>	Collective arguments descriptor
in	<i>team</i>	Input Team

##### Description

`ucc_collective_init_and_post` initializes the collective operation and also posts the operation.

Note

: The `ucc_collective_init_and_post` can be implemented as a combination of `ucc_collective_init` and `ucc_collective_post` routines.

Returns

Error code as defined by `ucc_status_t`

#### 8.8.4.4 `ucc_collective_test()`

```
static ucc_status_t ucc_collective_test (
    ucc_coll_req_h request ) [inline], [static]
```

Parameters

in	<i>request</i>	Request handle
----	----------------	----------------

### Description

[ucc\\_collective\\_test](#) tests and returns the status of collective operation.

Returns

Error code as defined by `ucc_status_t`

#### 8.8.4.5 `ucc_collective_finalize()`

```
ucc_status_t ucc_collective_finalize (
    ucc_coll_req_h request )
```

Parameters

in	<i>request</i>	- request handle
----	----------------	------------------

### Description

[ucc\\_collective\\_finalize](#) operation releases all resources associated with the collective operation represented by the request handle.

Returns

Error code as defined by `ucc_status_t`

## 8.9 Events and Triggered operations' datastructures

### Data Structures

- struct `ucc_event`
- struct `ucc_ee_params`

### Typedefs

- typedef enum `ucc_event_type` `ucc_event_type_t`
- typedef enum `ucc_ee_type` `ucc_ee_type_t`
- typedef struct `ucc_event` `ucc_ev_t`
- typedef struct `ucc_ee_params` `ucc_ee_params_t`

### Enumerations

- enum `ucc_event_type` {  
`UCC_EVENT_COLLECTIVE_POST` = `UCC_BIT(0)`,  
`UCC_EVENT_COLLECTIVE_COMPLETE` = `UCC_BIT(1)`,  
`UCC_EVENT_COMPUTE_COMPLETE` = `UCC_BIT(2)`,  
`UCC_EVENT_OVERFLOW` = `UCC_BIT(3)` }
- enum `ucc_ee_type` {  
`UCC_EE_CUDA_STREAM` = 0,  
`UCC_EE_CPU_THREAD`,  
`UCC_EE_LAST`,  
`UCC_EE_UNKNOWN` = `UCC_EE_LAST` }

enum ucc_ee_type
```

Enumerator

UCC_EE_CUDA_STREAM	
UCC_EE_CPU_THREAD	
UCC_EE_LAST	
UCC_EE_UNKNOWN	

## 8.10 Events and Triggered Operations

### Functions

- `ucc_status_t ucc_ee_create (ucc_team_h team, const ucc_ee_params_t *params, ucc_ee_h *ee)`  
The routine creates the execution context for collective operations.
- `ucc_status_t ucc_ee_destroy (ucc_ee_h ee)`  
The routine destroys the execution context created for collective operations.
- `ucc_status_t ucc_ee_get_event (ucc_ee_h ee, ucc_ev_t **ev)`  
The routine gets the event from the event queue.
- `ucc_status_t ucc_ee_ack_event (ucc_ee_h ee, ucc_ev_t *ev)`  
The routine acks the events from the event queue.
- `ucc_status_t ucc_ee_set_event (ucc_ee_h ee, ucc_ev_t *ev)`  
The routine to set the event to the tail of the queue.
- `ucc_status_t ucc_ee_wait (ucc_ee_h ee, ucc_ev_t *ev)`  
The routine blocks the calling thread until there is an event on the queue.
- `ucc_status_t ucc_collective_triggered_post (ucc_ee_h ee, ucc_ev_t *ee_event)`  
The routine posts the collective operation on the execution engine, which is launched on the event.

### 8.10.1 Detailed Description

Event-driven Collective Execution

### 8.10.2 Function Documentation

#### 8.10.2.1 ucc\_ee\_create()

```
ucc_status_t ucc_ee_create (
    ucc_team_h team,
    const ucc_ee_params_t * params,
    ucc_ee_h * ee )
```

Parameters

in	<i>team</i>	team handle
in	<i>params</i>	user provided params to customize the execution engine
out	<i>ee</i>	execution engine handle

#### Description

`ucc_ee_create` creates the execution engine. It enables event-driven collective execution. `ucc_ee_params_t` allows the execution engine to be configured to abstract either GPU and CPU threads. The execution engine is created and coupled with the team. There can be many execution engines coupled to the team. However, attaching the same execution engine to multiple teams is not allowed. The execution engine is created after the team is created and destroyed before the team is destroyed. It is the user's responsibility to destroy the execution engines before the team. If the team is destroyed before the execution engine is destroyed, the result is undefined.

Returns

Error code as defined by `ucc_status_t`

#### 8.10.2.2 ucc\_ee\_destroy()

```
ucc_status_t ucc_ee_destroy (
    ucc_ee_h ee )
```

## Parameters

in	ee	Execution engine handle
----	----	-------------------------

**Description**

[ucc\\_ee\\_destroy](#) releases the resources attached with the execution engine and destroys the execution engine. All events and triggered operations related to this ee are invalid after the destroy operation. To avoid race between the creation and destroying the execution engine, for a given ee, the [ucc\\_ee\\_create](#) and [ucc\\_ee\\_destroy](#) must be invoked from the same thread.

## Returns

Error code as defined by `ucc_status_t`

**8.10.2.3 ucc\_ee\_get\_event()**

```
ucc_status_t ucc_ee_get_event (
    ucc_ee_h ee,
    ucc_ev_t ** ev )
```

## Parameters

in	ee	execution engine handle
out	ev	Event structure fetched from the event queue

**Description**

[ucc\\_ee\\_get\\_event](#) fetches the events from the execution engine. If there are no events posted on the ee, it returns immediately without waiting for events. All events must be acknowledged using the [ucc\\_ee\\_ack\\_event](#) interface. The event acknowledged is destroyed by the library. An event fetched with [ucc\\_ee\\_get\\_event](#) but not acknowledged might consume resources in the library.

## Returns

Error code as defined by `ucc_status_t`

**8.10.2.4 ucc\_ee\_ack\_event()**

```
ucc_status_t ucc_ee_ack_event (
    ucc_ee_h ee,
    ucc_ev_t * ev )
```

## Parameters

in	ee	execution engine handle
in	ev	Event to be acked

**Description**

An event acknowledged by the user using [ucc\\_ee\\_ack\\_event](#) is destroyed by the library. Any triggered operations on the event should be completed before calling this interface. The behavior is undefined if the user acknowledges the event while waiting on the event or triggering operations on the event.

Returns

Error code as defined by `ucc_status_t`

#### 8.10.2.5 `ucc_ee_set_event()`

```
ucc_status_t ucc_ee_set_event (
    ucc_ee_h ee,
    ucc_ev_t * ev )
```

Parameters

in	ee	execution engine handle
in	ev	Event structure fetched from the event queue

#### Description

`ucc_ee_set_event` sets the event on the execution engine. If the operations are waiting on the event when the user sets the event, the operations are launched. The events created by the user need to be destroyed by the user.

Returns

Error code as defined by `ucc_status_t`

#### 8.10.2.6 `ucc_ee_wait()`

```
ucc_status_t ucc_ee_wait (
    ucc_ee_h ee,
    ucc_ev_t * ev )
```

Parameters

in	ee	execution engine handle
out	ev	Event structure fetched from the event queue

#### Description

The user thread invoking the `ucc_ee_wait` interface is blocked until an event is posted to the execution engine.

Returns

Error code as defined by `ucc_status_t`

#### 8.10.2.7 `ucc_collective_triggered_post()`

```
ucc_status_t ucc_collective_triggered_post (
    ucc_ee_h ee,
    ucc_ev_t * ee_event )
```

Parameters

in	ee	execution engine handle
in	ee_event	Event triggering the post operation

#### Description

`ucc_collective_triggered_post` allow the users to schedule a collective operation that executes in the future

when an event occurs on the execution engine.

Returns

Error code as defined by `ucc_status_t`

## 8.11 Utility Operations

### Enumerations

- enum `ucc_config_print_flags_t` {  
`UCC_CONFIG_PRINT_CONFIG` = `UCC_BIT(0)`,  
`UCC_CONFIG_PRINT_HEADER` = `UCC_BIT(1)`,

UCC_ERR_LAST	

### 8.11.3 Function Documentation

#### 8.11.3.1 ucc\_status\_string()

```
const char* ucc_status_string (  
    ucc_status_t status )
```

## Chapter 9

# Data Structure Documentation

### 9.1 ucc\_coll\_callback Struct Reference

UCC collective completion callback.

#### Data Fields

- void(\* [cb](#))(void \*[data](#), [ucc\\_status\\_t](#) status)
- void \* [data](#)

#### 9.1.1 Detailed Description

The callback is invoked whenever the collective operation is completed. It is not allowed to call UCC APIs from the completion callback except for [ucc\\_collective\\_finalize](#).

#### 9.1.2 Field Documentation

##### 9.1.2.1 cb

```
void(* ucc_coll_callback::cb) (void *data, ucc\_status\_t status)
```

##### 9.1.2.2 data

```
void* ucc_coll_callback::data
```

The documentation for this struct was generated from the following file:

- [ucc\\_def.h](#)

### 9.2 ucc\_context\_oob\_coll Struct Reference

OOB collective operation for creating the context.

#### Data Fields

- [ucc\\_status\\_t](#)(\* [allgather](#) )(void \*src\_buf, void \*recv\_buf, size\_t size, void \*allgather\_info, void \*\*request)
- [ucc\\_status\\_t](#)(\* [req\\_test](#) )(void \*request)
- [ucc\\_status\\_t](#)(\* [req\\_free](#) )(void \*request)
- uint32\_t [participants](#)
- void \* [coll\\_info](#)

## 9.2.1 Field Documentation

### 9.2.1.1 allgather

```
ucc_status_t(* ucc_context_oob_coll::allgather) (void *src_buf, void *recv_buf, size_t size,
void *allgather_info, void **request)
```

### 9.2.1.2 req\_test

```
ucc_status_t(* ucc_context_oob_coll::req_test) (void *request)
```

### 9.2.1.3 req\_free

```
ucc_status_t(* ucc_context_oob_coll::req_free) (void *request)
```

### 9.2.1.4 participants

```
uint32_t ucc_context_oob_coll::participants
```

### 9.2.1.5 coll\_info

```
void* ucc_context_oob_coll::coll_info
```

The documentation for this struct was generated from the following file:

- ucc.h

## 9.3 ucc\_ep\_map\_cb Struct Reference

### Data Fields

- uint64\_t(\* [cb](#))(uint64\_t ep, void \*[cb\\_ctx](#))
- void \* [cb\\_ctx](#)

## 9.3.1 Field Documentation

### 9.3.1.1 cb

```
uint64_t(* ucc_ep_map_cb::cb) (uint64_t ep, void *cb\_ctx)
```

### 9.3.1.2 cb\_ctx

```
void* ucc_ep_map_cb::cb_ctx
```

The documentation for this struct was generated from the following file:

- ucc.h

## 9.4 ucc\_team\_oob\_coll Struct Reference

### Data Fields

- [ucc\\_status\\_t](#)(\* [allgather](#))(void \*src\_buf, void \*recv\_buf, size\_t size, void \*allgather\_info, void \*\*request)

- `ucc_status_t(* req_test)(void *request)`
- `ucc_status_t(* req_free)(void *request)`
- `uint32_t participants`
- `void * coll_info`

### 9.4.1 Field Documentation

#### 9.4.1.1 allgather

`ucc_status_t(* ucc_team_oob_coll::allgather)(void *src_buf, void *recv_buf, size_t size, void *allgather_info, void **request)`

#### 9.4.1.2 req\_test

`ucc_status_t(* ucc_team_oob_coll::req_test)(void *request)`

#### 9.4.1.3 req\_free

`ucc_status_t(* ucc_team_oob_coll::req_free)(void *request)`

#### 9.4.1.4 participants

`uint32_t ucc_team_oob_coll::participants`

#### 9.4.1.5 coll\_info

`void* ucc_team_oob_coll::coll_info`

The documentation for this struct was generated from the following file:

- `ucc.h`

## 9.5 ucc\_team\_p2p\_conn Struct Reference

### Data Fields

- `int(* conn_info_lookup)(void *conn_ctx, uint64_t ep, ucc_p2p_conn_t **conn_info, void *request)`
- `int(* conn_info_release)(ucc_p2p_conn_t *conn_info)`
- `void * conn_ctx`
- `ucc_status_t(* req_test)(void *request)`
- `ucc_status_t(* req_free)(void *request)`

### 9.5.1 Field Documentation

#### 9.5.1.1 conn\_info\_lookup

`int(* ucc_team_p2p_conn::conn_info_lookup)(void *conn_ctx, uint64_t ep, ucc_p2p_conn_t **conn_info, void *request)`

### 9.5.1.2 conn\_info\_release

```
int (* ucc_team_p2p_conn::conn_info_release) (ucc_p2p_conn_t *conn_info)
```

### 9.5.1.3 conn\_ctx

```
void* ucc_team_p2p_conn::conn_ctx
```

### 9.5.1.4 req\_test

```
ucc_status_t (* ucc_team_p2p_conn::req_test) (void *request)
```

### 9.5.1.5 req\_free

```
ucc_status_t (* ucc_team_p2p_conn::req_free) (void *request)
```

The documentation for this struct was generated from the following file:

- ucc.h
